Data Taming Assignment 1

Dongju Ma

15/06/2024

Setup

```
#Load the required packages
library(tidyverse)
library(inspectdf)
```

Q1. Loading the data

```
# Your student number goes here
ysn = 1942340
# Calculate your student number modulo 3
filenum <- ysn %% 3
filenum
```

```
## [1] 2
```

```
filename <- paste0("./data/afl_",filenum,".csv")
filename
```

```
## [1] "./data/afl_2.csv"
```

```
# Read in the data
afl<-read_csv("./data/afl_2.csv")
# Display the first 10 lines of the data
afl
```

```
## # A tibble: 18 x 24
##    Team    State Round01 Round02 Round03 Round04 Round05 Round06 Round07 Round08
##    <chr>   <chr> <chr>   <chr>   <chr>   <chr>   <chr>   <chr>   <chr>   <chr>
##  1 Collin~ VIC   away g~ home g~ away g~ home g~ home g~ away g~ home g~ away g~
##  2 St Kil~ VIC   away g~ home g~ home g~ home g~ away g~ away g~ home g~ home g~

## 17 Adelai~ New ~ away g~ home g~ away g~ home g~ away g~ home g~ home g~ away g~
## 18 West C~ WA    away g~ home g~ away g~ home g~ away g~ home g~ home g~ away g~
## # i 14 more variables: Round09 <chr>, Round10 <chr>, Round11 <chr>,
## #   Round12 <chr>, Round13 <chr>, Round14 <chr>, Round15 <chr>, Round16 <chr>,
## #   Round17 <chr>, Round18 <chr>, Round19 <chr>, Round20 <chr>, Round21 <chr>,
## #   Round22 <chr>
```

Q2. The dimensions of the data set

```
#Use dim to show the numbers of rows and columns
dim(afl)
```

```
## [1] 18 24
```

The data set has 18 rows and 24 columns.

Q3. Random permutation of the rows

```
# Set the random seed
set.seed(1942340)
# Use sample_n to get the random permutation of the rows
afl1<-sample_n(afl,18,replace = FALSE)
afl1
```

```
## # A tibble: 18 x 24
##    Team    State Round01 Round02 Round03 Round04 Round05 Round06 Round07 Round08

## # i 15 more variables: Round08 <chr>, Round09 <chr>, Round10 <chr>,
## #   Round11 <chr>, Round12 <chr>, Round13 <chr>, Round14 <chr>, Round15 <chr>,
## #   Round16 <chr>, Round17 <chr>, Round18 <chr>, Round19 <chr>, Round20 <chr>,
## #   Round21 <chr>, Round22 <chr>
```

Q5 Data cleaning

Q5.(a) Remove column

```
# Use filter to extract the rows without text data.
afl1<-filter(afl1,Team!="testX1")
# Make sure the row numbers are updated
afl1<-mutate(afl1,RowNum=c(1:17))
```

Q5.(b) Fix the wrong names

```
# Change Team name "Adelaide" to "Port Adelaide"
afl1[9,]$Team<-str_replace(afl1[9,]$Team,"Adelaide","Port Adelaide")
# Change Team name "Melbourne" to "North Melbourne"
afl1[14,]$Team<-str_replace(afl1[14,]$Team,"Melbourne","North Melbourne")
# Change State "Queensld" to "QLD"
afl1[4,]$State<-str_replace(afl1[4,]$State,"Queensld","QLD")
# Change State "New South Wales" to "SA"
afl1[9,]$State<-str_replace(afl1[9,]$State,"New South Wales","SA")
# Change State "bictoria" to "VIC"
afl1[15,]$State<-str_replace(afl1[15,]$State,"bictoria","VIC")
```

Q5.(c) Sort by team names

```
# Use arrange to sort the tibble by team name
afl1<-arrange(afl1,Team)
afl1
```

```
## # A tibble: 17 x 25
##    RowNum Team     State Round01 Round02 Round03 Round04 Round05 Round06 Round07
##     <int> <chr>    <chr> <chr>   <chr>   <chr>   <chr>   <chr>   <chr>   <chr>
##  1      4 Brisban~ QLD   home g~ home g~ away g~ home g~ away g~ away g~ home g~
##  2      1 Carlton  VIC   away g~ away g~ home g~ away g~ home g~ home g~ away g~
##  3     10 Carlton  VIC   away g~ away g~ home g~ away g~ home g~ home g~ away g~
##  4      6 Colling~ VIC   away g~ home g~ away g~ home g~ home g~ away g~ home g~
##  5     17 Essendon VIC   away g~ home g~ away g~ away g~ away g~ home g~ home g~
##  6      5 Fremant~ WA    home g~ away g~ home g~ away g~ home g~ away g~ away g~
##  7      3 Geelong  VIC   home g~ away g~ away g~ home g~ away g~ home g~ home g~
##  8     15 Hawthorn VIC   away g~ home g~ away g~ away g~ home g~ away g~ away g~
##  9     13 North M~ VIC   away g~ away g~ home g~ home g~ away g~ home g~ away g~
## 10     14 North M~ VIC   home g~ away g~ home g~ away g~ home g~ away g~ home g~
## 11      2 Port Ad~ SA    home g~ away g~ home g~ away g~ home g~ away g~ away g~
## 12      9 Port Ad~ SA    away g~ home g~ away g~ home g~ away g~ home g~ home g~
## 13     11 Richmond VIC   home g~ home g~ away g~ home g~ away g~ away g~ away g~
## 14      8 St Kilda VIC   away g~ home g~ home g~ home g~ away g~ away g~ home g~
## 15     12 Sydney   NSW   home g~ away g~ home g~ away g~ home g~ home g~ away g~
## 16      7 West Co~ WA    away g~ home g~ away g~ home g~ away g~ home g~ home g~
## 17     16 Western~ VIC   home g~ away g~ home g~ away g~ home g~ home g~ away g~
```

```
## # i 15 more variables: Round08 <chr>, Round09 <chr>, Round10 <chr>,
## #   Round11 <chr>, Round12 <chr>, Round13 <chr>, Round14 <chr>, Round15 <chr>,
## #   Round16 <chr>, Round17 <chr>, Round18 <chr>, Round19 <chr>, Round20 <chr>,
## #   Round21 <chr>, Round22 <chr>
```

Q6. Data tidying

Q6.(a) Convert to long form

```
# Use gather to convert the data set to long form
afl1<- gather(afl1,key = "round",value = "details",'Round01':'Round22')
```

Q6.(b) Remove the characters

```
# Use sting replace to remove all the "Round" string in column round
afl1$round<-str_replace(afl1$round,"Round","")
```

Q6.(c) Create the new boolean column

```
# Judge is away in details column, and rename the result column 1 into home
afl1<-afl1 %>%
  mutate("home"=is.na(str_match(afl1$details,"away"))[,1])
```

Q6.(d) Seperate the detail column

```
# Dig the numbers by str_match and put the result into column goals and column behinds
afl1<-mutate(afl1,goals=str_match(afl1$details,"(\\d+) goals and (\\d+)")[,2])
afl1<-mutate(afl1,behinds=str_match(afl1$details,"(\\d+) goals and (\\d+)")[,3])
```

Q6.(e) Delete the column

```
# Delete the details column
afl1<-mutate(afl1,details=NULL)
```

Q6.(f) Add the new tidy row number column

```
# Add the TidyRowNum column right next to the origin RowNum
afl1<-mutate(afl1,TidyRowNum=(1:374), .after=RowNum)
afl1
```

```
## # A tibble: 374 x 8
##    RowNum TidyRowNum Team            State round home  goals behinds
##     <int>      <int> <chr>           <chr> <chr> <lgl> <chr> <chr>
##  1      4          1 Brisbane Lions  QLD   01    TRUE  16    18
##  2      1          2 Carlton         VIC   01    FALSE 18    12
##  3     10          3 Carlton         VIC   01    FALSE 18    12
##  4      6          4 Collingwood     VIC   01    FALSE 19    15
##  5     17          5 Essendon        VIC   01    FALSE 13    16
##  6      5          6 Fremantle       WA    01    TRUE  17    16
##  7      3          7 Geelong         VIC   01    TRUE  19    11
##  8     15          8 Hawthorn        VIC   01    FALSE 17    15
##  9     13          9 North Melbourne VIC   01    FALSE 12    10
## 10     14         10 North Melbourne VIC   01    TRUE  8     13
## # i 364 more rows
```

Q7. Identifying data types

- Row Num: Categorical Ordinal. The numbers represent the teams and round status is home or away. For example number 1 indicates team Carlton's away games.
- Tidy Row Num: Categorical Ordinal. The tidy row numbers are integers indicate the order of this data set.
- Team: Categorical Nominal. They are the names of teams in AFL.
- State: Categorical Nominal.. They are the names of the states.
- Round: Categorical Nominal. The characters represents the rounds in the match season, which is in the range of 01 to 22.
- home: Categorical Nominal. There are only two categories in this variables, TRUE means the game is home and FALSE means away.
- goals: Quantitative Discrete. The numbers are integers represent the goals' points in each game and they can be really huge theoretically.
- behinds: Quantitative Discrete. The numbers are integers represent the points in behinds and they can be really huge theoretically.

Q8. Taming the data

```
# Change the blank spaces in Team into "_"
afl1$Team<-str_replace(afl1$Team," ","_")
# Change the number characters into integers
afl1$round<-as.integer(afl1$round)
afl1$goals<-as.integer(afl1$goals)
afl1$behinds<-as.integer(afl1$behinds)
# Check if there is any NA
inspect_na(afl1)
```

```
## # A tibble: 8 x 3
##   col_name     cnt  pcnt
```

```
##   <chr>      <int> <dbl>
## 1 RowNum         0     0
## 2 TidyRowNum     0     0
## 3 Team           0     0
## 4 State          0     0
## 5 round          0     0
## 6 home           0     0
## 7 goals          0     0
## 8 behinds        0     0
```

```
afl1
```

```
## # A tibble: 374 x 8
##    RowNum TidyRowNum Team           State round home  goals behinds
##     <int>      <int> <chr>          <chr> <int> <lgl> <int>   <int>
##  1      4          1 Brisbane_Lions QLD       1 TRUE     16      18
##  2      1          2 Carlton        VIC       1 FALSE    18      12
##  3     10          3 Carlton        VIC       1 FALSE    18      12
##  4      6          4 Collingwood    VIC       1 FALSE    19      15
##  5     17          5 Essendon       VIC       1 FALSE    13      16
##  6      5          6 Fremantle      WA        1 TRUE     17      16
##  7      3          7 Geelong        VIC       1 TRUE     19      11
##  8     15          8 Hawthorn       VIC       1 FALSE    17      15
##  9     13          9 North_Melbourne VIC      1 FALSE    12      10
## 10     14         10 North_Melbourne VIC      1 TRUE      8      13
## # i 364 more rows
```

Q9. Set the new data set

```
set.seed(1942340)
afl2<-sample_n(afl1,200)
afl2
```

```
## # A tibble: 200 x 8
##    RowNum TidyRowNum Team             State round home  goals behinds
##     <int>      <int> <chr>            <chr> <int> <lgl> <int>   <int>
##  1     12         15 Sydney           NSW       1 TRUE     13      10
##  2     14        299 North_Melbourne  VIC      18 FALSE    11       8
##  3     16        170 Western_Bulldogs VIC      10 FALSE    14       6
##  4      9        301 Port_Adelaide    SA       18 FALSE    11      14
##  5      1        172 Carlton          VIC      11 TRUE     15      11
##  6      6        174 Collingwood      VIC      11 TRUE     17      11
##  7     12        338 Sydney           NSW      20 FALSE    14      12
##  8     13        281 North_Melbourne  VIC      17 TRUE     18      11
##  9      3         75 Geelong          VIC       5 FALSE     9      14
## 10      4        120 Brisbane_Lions   QLD       8 TRUE     10      14
## # i 190 more rows
```

Q10. Caculation for data analyzing assistence

Q10.(a) Insert two new columns

```
# Calculate the score and accuracy and insert the new columns
afl2<-mutate(afl2,score=goals*6+behinds)
afl2<-mutate(afl2,accuracy=goals/(goals+behinds))
```

The score variable is Quantitative Discrete while the accuracy variable is Quantitative Continuous. The score's type is incorrect, it should be integers and the accuracy's is correct.

```
# Convert the score variable to integers
afl2$score<-as.integer(afl2$score)
afl2
```

```
## # A tibble: 200 x 10
##    RowNum TidyRowNum Team         State round home  goals behinds score accuracy
##     <int>      <int> <chr>        <chr> <int> <lgl> <int>   <int> <int>    <dbl>
##  1     12         15 Sydney       NSW       1 TRUE     13      10    88    0.565
##  2     14        299 North_Melbo~ VIC      18 FALSE    11       8    74    0.579
##  3     16        170 Western_Bul~ VIC      10 FALSE    14       6    90    0.7
##  4      9        301 Port_Adelai~ SA       18 FALSE    11      14    80    0.44
##  5      1        172 Carlton      VIC      11 TRUE     15      11   101    0.577
##  6      6        174 Collingwood  VIC      11 TRUE     17      11   113    0.607
##  7     12        338 Sydney       NSW      20 FALSE    14      12    96    0.538

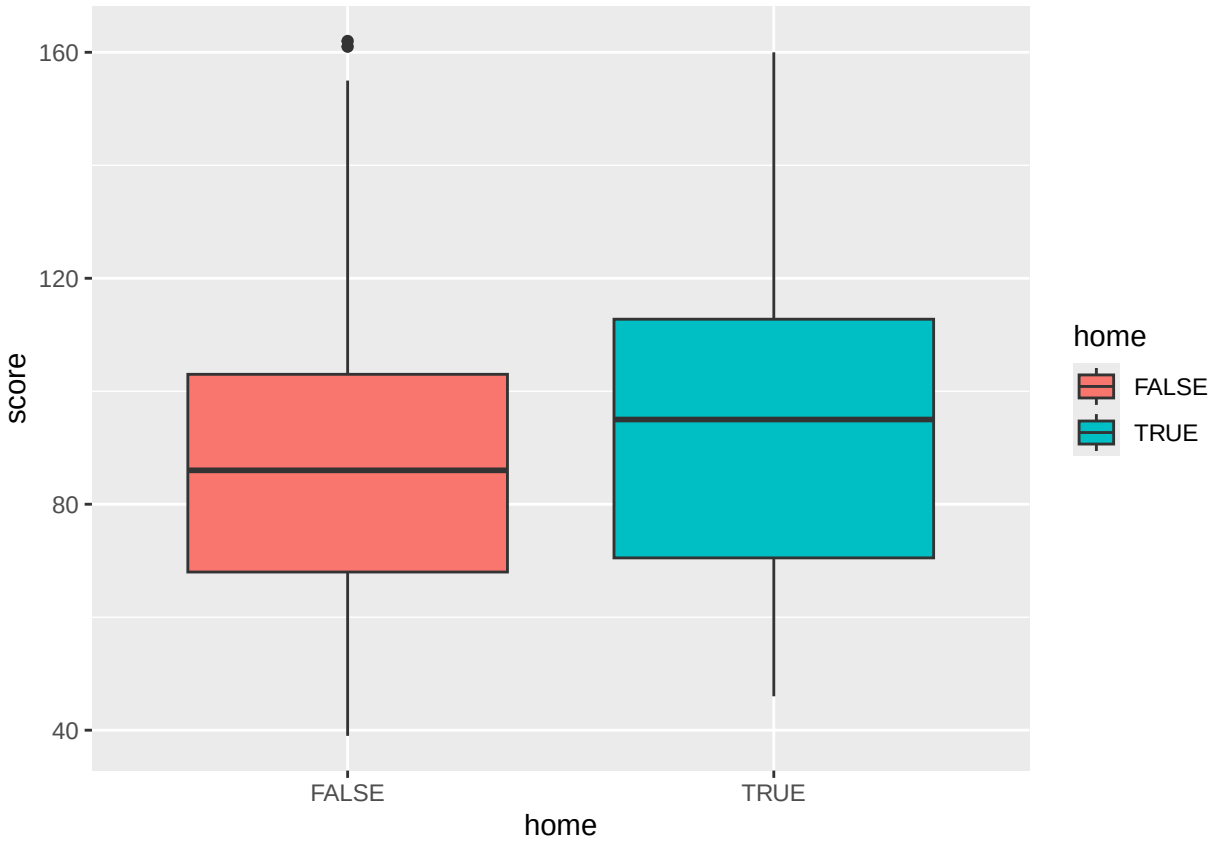
Q11. Box plots

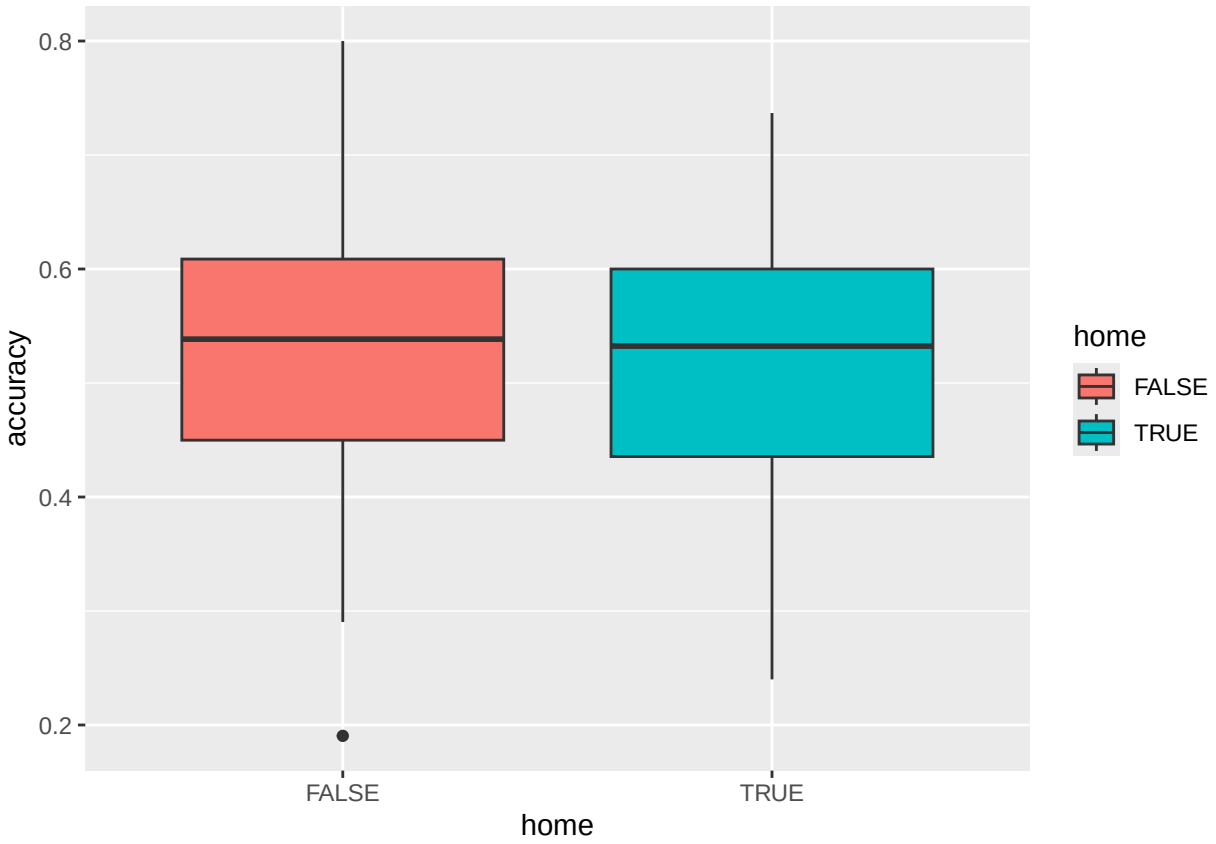
Q11.(a) Box plot of score and home

```
# Plot the data of home and score
ggplot(afl2,aes(home,score,fill=home))+
  geom_boxplot()
```



Q11.(b) Box plot of accuracy and home

```
# Plot the data of home and accuracy
ggplot(af12,aes(home,accuracy,fill=home))+
  geom_boxplot()
```



The home games have better probabilities to win more scores but the accuracy between home and away is very close. With the graph we can see the average line of home score is higher But when it comes to the accuracy graph their position is much closer. So from the average score lines we can see it's more likely to win in a home game.

Q12. Data screening

```
# Screen the data by home is home or away
afl_home<-filter(afl2,home==TRUE)
afl_away<-filter(afl2,home==FALSE)
afl_home
```

```
## # A tibble: 98 x 10
##    RowNum TidyRowNum Team         State round home  goals behinds score accuracy

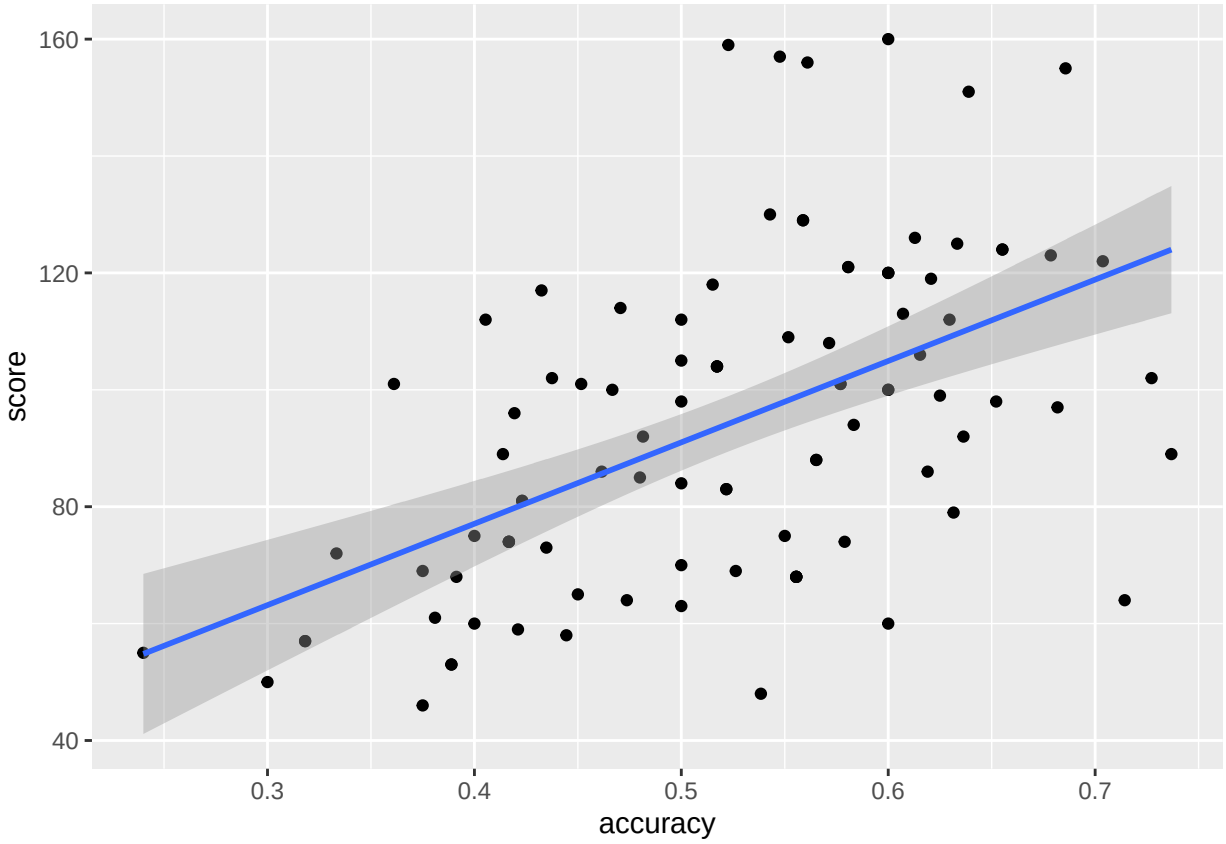
## 1 RowNum       1     4.25    9.5     8.98   13      17     5.13        0 <tibble>
## 2 TidyRowN~    4    83     176.    181.    284.    373   112.          0 <tibble>
## 3 round        1     5.25   11      11.2    17      22     6.59        0 <tibble>
## 4 goals        4    10      12      12.6    15      25     4.23        0 <tibble>
## 5 behinds      3     8      10      11.1    14      23     4.39        0 <tibble>
## 6 score       39    68      86      87.0   103     162    26.7         0 <tibble>
## 7 accuracy     0.190 0.450   0.538   0.537   0.609   0.8   0.114       0 <tibble>
```

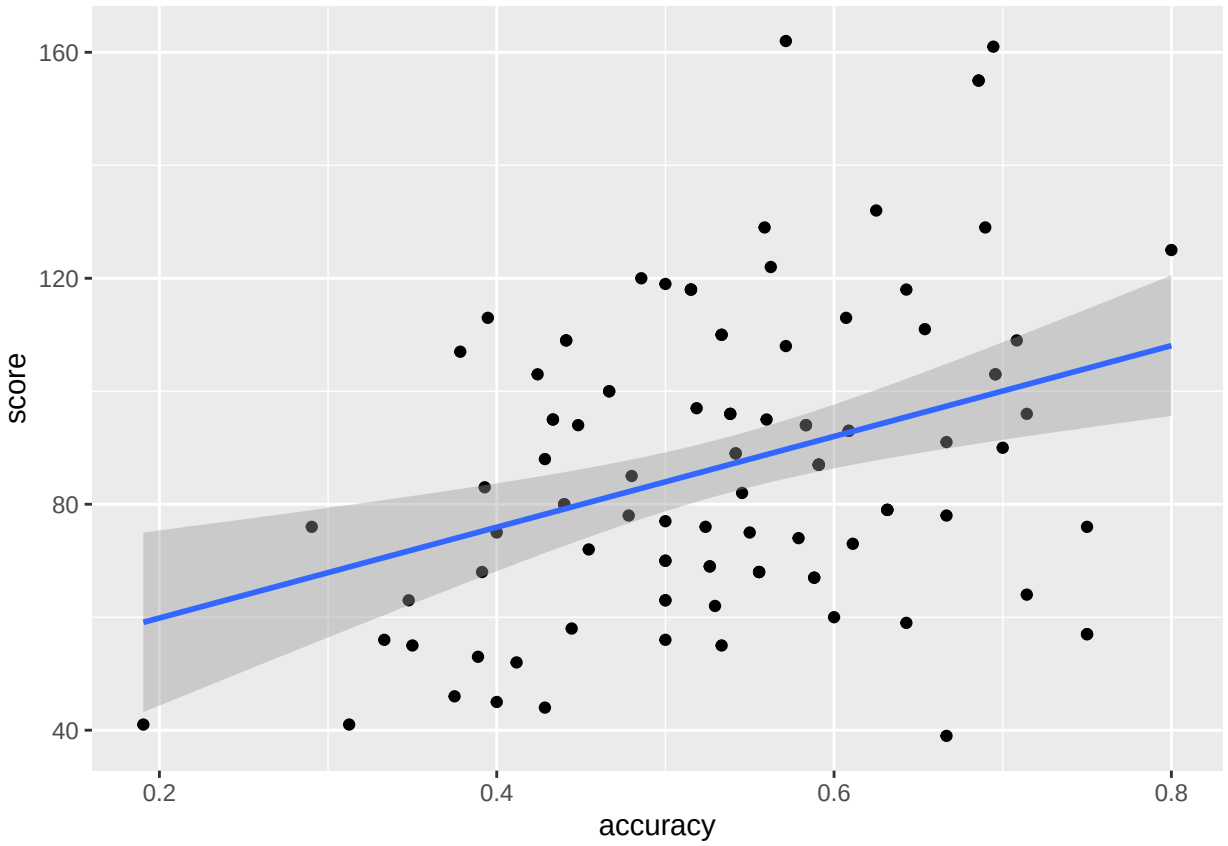
The average score of home games is 94.0510204 while the average accuracy is 0.5218593. Also the average score of away games 86.9803922 while the average accuracy is 86.9803922. The data does support the claim.

Q14. Scatter plots

```
# Plot the scatter plot of accuracy and score in afl_home
ggplot(afl_home, aes(x = accuracy, y = score)) +
  geom_point() +
  geom_smooth(method="lm")
```



```
# Plot the scatter plot of accuracy and score in afl_away
ggplot(afl_away, aes(x = accuracy, y = score)) +
  geom_point() +
  geom_smooth(method="lm")
```



The calculation of score is to multiple goals numbers with 6 and behinds just 1 time and the accuracy represent the proportion of goals, which infers that with higher accuracy come to higher goals. And the higher goals change into higher scores. So I choose the accuracy to be the independent variable and the score to be predictor.

Q15. Relationship between accuracy and score

As the scatter plots shown, when the accuracy data becomes higher, there are higher possibilities to win a high score. And it is similar for both home and away teams.
